#### FOREWORD

This report on average quantities of fresh fruits and vegetables loaded per car, proportion of carlot shipments marketed in various containers, and other information on shipments, is based on a sample analysis of the Federal-State shipping-point inspection certificates on carlot shipments.

Since the carload is the generally accepted unit of fruit and vegetable movement to market, it is important to know the average quantities loaded per car. The average carload by commodities, origins, and periods of shipment is shown in this report in terms of units generally used in official production and price reports, as bushels, tons, etc. Factors used in converting contents of various containers in which shipments were made, to these standard or common units, are included in a table in the report. In a few instances where the loading varied considerably with the season of the year, separate averages are shown in the report by months or seasons. Some information is included on the proportion of various varieties and grades represented on the carlot inspection certificates, commodities included in so-called "mixed car" shipments, and whether or not shipments were under refrigeration.

Certificates representing shipments during part or all of several recent seasons were used in this analysis. For various reasons it was impracticable to use the same period of shipment in the tabulations for all commodities from all sources. Although the approximate average of 425,000 carlots inspected at shipping points in the 2 years ended June 30, 1939 was roughly half of the United States carlot shipments of fruits and vegetables, there were some commodities in some States for which few if any inspections were made. This report does not, therefore, include information on all fruits and vegetables from all States. The inspection service is not used by all shippers or in all districts in all States. The certificates may not therefore be entirely representative of all carlot shipments. Furthermore, information on proportion of shipments by variety, grade, and container may not be entirely representative of all shipments to market because there is a large movement by truck which is not represented in this report. On the whole, however, the information presented is believed to be fairly representative.

In sampling the certificates for tabulation, the number used was about 10 percent of the number available for each commodity, State of origin, and month. In some instances, only a small number of certificates were available but the information from these, if thought to be fairly representative, was used. The total number of carlot inspection certificates used in the analysis was approximately 58,000.

The portion of this report relating to car loadings differs from the "Table of Number of Packages per Carload" issued in February 1937, in that it shows the indicated average quantities loaded per car in terms of standard units for States and commodities covered by the certificates, whereas the Table of Number of Packages per Carload shows a range in the number of packages and the usual number loaded for all States and commodities.

# AVERAGE QUANTITIES OF LEADING FRUITS AND VEGETABLES LOADED PER CAR, AND PROPORTIONS SHIPPED IN VARIOUS CONTAINERS, FOR SPECIFIED PERIODS, 1936-39

(Information from shipping-point carlot inspection certificates)

#### FACTORS USED IN CONVERTING TO STANDARD UNITS

(The standard unit used for each commodity is shown in parenthesis after the name of the commodity. Dimensions of crates shown are inside dimensions in inches.)

APPLES (bushel) - The following containers were considered as holding 1 bushel: bushel basket, eastern apple crate, field box, and northwestern apple box. The following factors were used: 1 barrel equals 3 bushels and 1 bushel equals 48 pounds.

APPLES, dried (ton).

APRICOTS, (ton).

ARTICHOKES (40-pound box).

ASPARAGUS (crate of 1 dozen 2-pound bunches).

BEANS, snap and lima in pod (bushel).

BEETS, without tops (bushel).

BROCCOLI (pony crate approximately 8½"x18"x21-5/8" and containing about 1½ bushels).

CABBAGE (ton) - The following factors were used: One western or Los Angeles lettuce crate, 80 pounds; one half crate, 40 pounds; one pony crate, 60 pounds; one 1½-bushel hamper, 50 pounds; one 1-1/6 bushel hamper, 39 pounds; one bushel, 33 pounds.

CANTALOUPS (standard crate, approximately 60 pounds). One jumbo crate was considered

CANTALOUPS (standard crate, approximately 60 pounds). One jumbo crate was considered equal to 1-1/6 standard crates. Three flat crates or flats were considered equal to one standard crate.

CARROTS, bunched (western or Los Angeles lettuce crate, approximately 13"x18"x21-5/8")
Two half crates equal one western crate.

CARROTS, without tops (bushel) - One 50-pound sack was considered as one bushel.

CAULIFLOWER (pony crate, approximately 82"x18"x21-5/8" containing about 12 bushels).

CELERY (half crate) - Varies somewhat in dimensions; in California usually 22" or 24"xll"x20-5/8". Factors used were: one Florida standard crate (20"xl0"x22") equals a half crate; l 16-inch crate (approximately 16"xl0"x22", containing celery with clipped tops) equals a half crate. One two-thirds crate equals 1-1/3 half crates.

CHERRIES (ton) - The following containers were considered as having the net weights indicated: Campbell lug, 15 pounds; 1 bushel, 56 pounds.

CHERRIES, in brine (barrel) approximately 425-450 pounds net.

CORN, green (ton) - The weight of one bushel was considered as 35 pounds.

CUCUMBERS (bushel).

ENDIVE (Chicory), (western or Los Angeles lettuce crate containing approximately 55-60 pounds).

GARLIC (50-pound sack).

GRAPEFRUIT (standard grapefruit box) - The size of the box used in Florida and Texas differs from that used in Arizona and California. The standard grapefruit box used in Florida and Texas contains approximately 1 3/5-bushels and that used in Arizona and California approximately 1½ bushels. For Florida and Texas for the purpose of this report the following factors were used: a 2-bushel box equals 1.2 standard grapefruit box; a 1-3/5 bushel sack equals 0.97 standard grapefruit box; a 4/5 bushel sack equals 0.485 standard grapefruit box; a field box equals 1 standard grapefruit box. For Arizona a 1-3/5 bushel sack was considered equal to 1 grapefruit box.

GRAPES (ton) - The following factors were used: One lug, lidded or open, 28 pounds; one 4-basket crate, 20 pounds; one sawdust chest, 34 pounds; one 4-quart basket, 6 pounds; one 12-quart basket, 18 pounds; one carton of twelve 2-quart baskets, 36 pounds; one 9-basket crate, 20 pounds.

HONEY DEW MELONS (standard honey dew crate containing approximately 40 pounds) - The Jumbo honey dew crate was here considered as weighing approximately 47 pounds net. KALE (bushel).

LEMONS (lemon box).

LETTUCE (western or Los Angeles lettuce crate) - Two half crates were considered equal to one western or Los Angeles crate.

ONIONS (50-pound sack).

ORANGES (standard orange box) - The standard orange box used in Florida and Texas contains approximately 1-3/5 bushels and that used in Arizona and California approximately 12 bushels. Factors used were not in all cases directly proportionate to contents, because of bulge, tightness of pack, etc. Florida and Texas the following factors were used: a 2-bushel box equals 1.2 standard orange box; a 1-3/5 bushel sack equals 0.97 standard orange box; a 1-3/5 bushel wire-bound box equals a standard box; a 4/5-bushel sack equals 0.485 standard orange box; a field box equals one standard orange box. One bushel basket equals 5/8 standard orange box. For California and Arizona one unlidded orange box was considered equal to threefourths standard orange box, and one 1-3/5 bushel sack equal to one standard orange box.

PEACHES (bushel) - The weight of one western peach box was considered as 22 pounds;

one bushel as 48 pounds, and one lug or open lug as 20 pounds.

PEARS (bushel) - One bushel basket, or one western box was considered as one bushel. The weight of a bushel was considered as 50 pounds, and an open lug as 26 pounds. PEAS (bushel).

PEPPERS (bushel) - One Florida pepper crate was considered equal to 12 bushels.

PLUMS and FRESH PRUNES (ton) - The weight of one bushel was considered as 56 pounds

and the weight of a 4-basket crate as 20 pounds.

POTATOES (bushel) - Sacks of various weights were converted to bushels on the basis of 60 pounds per bushel. One bushel crate was considered as one bushel (the actual weight of early potatoes in a bushel crate is usually less than 60 pounds); one Los Angeles lug as 28 pounds; one peach box as 20 pounds; and one barrel as 2.75 bushels.

RADISHES (bushel).

RHUBARB (ton) - The weight of one hothouse box was considered as 15 pounds.

SATSUMAS (orange box) (See ORANGES).

SHALLOTS (bushel).

SPINACH (bushel).

STRAWBERRIES, fresh (quart) - Crates of various sizes were converted to quarts on the basis of their specified contents.

STRAWBERRIES, frozen pack (barrel).

SWEETPOTATOES (bushel) Sacks of various weights were converted to bushels on the basis of 55 pounds per bushel. One Louisiana crate (approximately 50 pounds) was considered equal to one bushel and one barrel equal to 2.75 bushels.

TANGERINES (orange box) - Two 4/5 bushel boxes were considered equal to one orange

box.

TOMATOES (bushel) - The weight of a bushel of tomatoes was considered as 53 pounds, the weight of one lug as 32 pounds and the weight of one 12-quart Climax basket as 20 pounds.

#### COMPOSITION OF MIXED CAR SHIPMENTS

Average quantities of MIXED CITRUS (cars containing two or more kinds of citrus fruit) per carload in terms of standard orange or grapefruit boxes and proportion of specified commodities in mixed car shipments as indicated by sample analysis of shipping-point carlot inspection certificates for specified States and periods

1/ The average net weight per carload of Louisiana mixed vegetables used in this tabulation was approximately 19,400 pounds. The sample totaled 151 cars.

<sup>2/</sup> Includes kohlrabi, romaine, peas, spinach, carrots, cardoon, leeks and possibly others.

A sample of 124 carlot certificates for TEXAS MIXED VEGETABLE shipments Jan.-May 1938 indicated a range in number of different vegetables per car of 2 to 11, with an average of 5. The certificates in most instances did not show the number of packages of each commodity in the car. Twenty eight different items or commodities were represented on the certificates. Following is a list of the commodities included in these mixed vegetable shipments from TEXAS, with the indicated percent of the number of cars in which each commodity was included:

#### PROPORTIONS OF LEADING VARIETIES OR TYPES - Continued

CABBAGE: The inspected shipments from South Carolina from November 1937 to April 1938 and from North Carolina in April and May 1938 and from Virginia in May and June 1938 were very largely pointed type. Inspected shipments from Louisiana, Mississippi, and Tennessee in the spring of 1938 were mostly domestic type, and those from Texas in 1939 were domestic type.

STRAWBERRIES: Data from the inspected shipments in 1938 gave the following indications as to varieties: For Alabama the Missionary was a leading variety. In Arkansas the Klondike led but there were some inspections of Blakemores and Aromas. Practically all Florida inspections were of the Missionary variety. Aroma was the leading variety inspected in Indiana and was important in Kentucky. Klondike was the important variety in Louisiana. In North Carolina Klondike and Missionary were leading varieties.

SWEETPOTATOES: The inspected shipments of Louisiana sweetpotatoes from July 1937 to June 1938 were all of the Puerto Rican variety. Inspected shipments from Virginia were largely Jersey type and Maryland Golden, from August to November 1939, and those from North Carolina in August and September 1938 were largely Jersey type.

#### GRADES

In order that the following information on grades may not be misleading or misunderstood, it is necessary to keep in mind some of the conditions and methods relating to the inspection work. The Federal-State shipping point inspection service is optional with the shipper except where there are State regulations or special marketing programs. The proportion of carlot shipments inspected, therefore, varies with States and commodities.

Shippers usually request inspection on the basis of a definite grade such as U. S. No. 1, and the inspection certificate is written on the basis of the requirements for the grade specified by the shipper. In some cases of this kind the shipment may have had the qualifications of a higher grade, such as "U. S. Fancy" or "U. S. Extra No. 1" for example, but the certificate does not indicate this fact. There are many instances where shippers request inspections for grade on only their high quality shipments, preferring to sell the poorer quality shipments on a brand, sample, or ungraded basis.

Conclusions as to relative quality of shipments of a product from various States based on the percentages of specified grades shown on the carlot inspection certificates would not be justified without proper consideration of other factors relating to inspection methods and conditions.

PROPORTIONS OF LEADING GRADES OF FRUITS AND VEGETABLES AS INDICATED BY SAMPLE ANALYSIS OF CARLOT INSPECTION CERTIFICATES FOR SPECIFIED STATES OF ORIGIN AND PERIODS OF SHIFMENT

ONIONS 1/

Inis tabulation is based on a sample of 1,155 carlot inspection certificates, varying in number among States from 10 for Ohio to 235 for Colorado. Inspections for all States listed except Texas and possibly a few for California, were based on grades for Northern grown onions. Inspections for Texas and a few for California were based on grades for Bermuda onions.

2/ Imports, inspected in Arizona.

#### PROPORTION OF LEADING GRADES - Continued

CANTALOUPS: A very large part of the inspected shipments from Arizona and Colorado in 1938; California in July 1939; and Indiana in 1937, met the U. S. No. 1 grade requirements.

CARROTS: The analysis indicated that approximately two-thirds of the inspected California carrot shipments from November 1937 to June 1938 were U. S. No. 1 grade.

CAULIFLOWER: Of the California shipments inspected from October 1937 to June 1938, about 80 percent graded U. S. No. 1. Most of the remainder were from 85-90 percent U. S. No. 1.

CELERY: About 70 percent of the inspected Florida shipments from December 1937 to June 1938 were U. S. No. 1 grade. The corresponding figure from January to May

1939 was 67 percent.

CORN: The majority of the inspected cars of southern corn in 1937 and 1938 graded

U. S. No. 1 or 80-90 percent U. S. No. 1.

GRAPEFRUIT: Approximately half of the inspected Florida shipments from September 1937 to June 1938 were U. S. Combination grade. During 1939, of the inspected shipments of Florida grapefruit about 7 percent were U. S. No. 1 grade including some Bronze and Russet; about 33 percent were U. S. No. 2 grade including some Russet. About 60 percent were U. S. Combination grade which included 34 percent designated as having 50 percent or more U. S. No. 1 quality and 5 percent designated as having less than 50 percent U. S. No. 1 quality (mostly 45 percent) and 21 percent as U. S. Combination without percentage of U. S. No. 1 specified. About 40 percent of the inspected Texas shipments from January to April 1938 were U. S. Combination grade and slightly less than 50 percent were U. S. No. 2 grade.

LETTUCE: The certificates indicated that somewhat over half the California and Arizona shipments from January to April 1938 were U. S. No. 1 grade. A large part

of the remainder graded from 80-90 percent U. S. No. 1.

ORANGES: Approximately one-half of the inspected Florida shipments from October 1937 to June 1938 graded U. S. Combination. In addition, considerable shipments (about 14 percent) graded U. S. Combination including specified proportions (above 50 percent) of U. S. No. 1 grade. Some shipments graded U. S. No. 3 and some U. S. No. 2. Of the Florida inspected shipments of oranges in 1939, about 6 percent were U. S. No. 1 grade including some Bronze and Russet; about 23 percent were U. S. No. 2 including some Russet; about 3 percent were U. S. No. 3. About 68 percent were U. S. Combination grade which included 47 percent designated as having 50 percent or more U. S. Mo. 1 quality and 1 percent designated as having less than 50 percent U. S. No. 1 quality (mostly 45 percent), and 20 percent as U. S. Combination without percentage of U. S. No. 1 specified. Approximately one-half of the Texas shipments which were inspected in 1938 were U. S. Combination and a large part of the remainder were U. S. No. 2. Over half of the California inspections from December 1937 to June 1938 were U. S. No. 2 grade. Among the other grade classifications represented in the California inspections were U. S. No. 1, U. S. No. 3, and 80-90 percent U. S. No. 1.

PEAS: Approximately 60 percent of the California inspections of peas from September 1937 to June 1938 were U. S. No. 1. Most of the remainder were from 80-88 percent U. S. No. 1. A large part of the inspected shipments from Colorado, Idaho, Wash-

ington, and Utah graded U. S. No. 1 or 85 percent U. S. No. 1.

PEPPERS: Of the inspected pepper shipments from January to June 1938 from Arizona and Florida, about 40 percent graded U. S. No. 1. A majority of the Louisiana, Texas, and Mississippi inspected shipments in 1938 graded U. S. No. 1.

PLUMS AND FRESH PRUMES: About three-fourths of the inspected California shipments graded U. S. No. 1 or U. S. No. 1 standard pack in the period July to September 1937 and June 1938. A very large part of the Idaho inspections in 1937 and the Washington and Oregon inspections in 1938 met the U. S. No. 1 requirements.

SPINACH: A very large proportion of the Texas, Virginia, and Washington spinach

shipments inspected in 1938 were U. S. No. 1 grade.

STRAWBERRIES: In 1938, over 90 percent of the Louisiana shipments were U. S. No. 1 grade. About two-thirds of the inspected Florida and Arkansas shipments and practically all of the inspected shipments in Indiana and Kentucky in 1938 were U. S. No. 1.

SWEETPOTATOES: About 90 percent of the Louisiana inspections from July 1937 to May 1938 were U. S. No. 1 grade. Inspections in Delaware in March and April 1938, and those in North Carolina in August and September 1938 were practically all U. S. No. 1 grade. Inspections in Virginia from August to November 1937 were about 97 percent U. S. No. 1 grade.

WATERMELONS: Nearly all of the inspected watermelon shipments from Florida, Georgia, and Mississippi in 1938 and from South Carolina, Louisiana, and Oklahoma in 1937

included in the tabulation were U. S. No. 1 grade.

# SHIPMENTS THAT WERE UNDER REFRIGERATION, IN UNICED REFRIGERATOR CARS, OR IN BOX CARS, AT TIME OF INSPECTION

- (As indicated by sample analysis of carlot shipping-point inspection certificates for 1937 and 1938. Shipments were classed as "under refrigeration" if the certificates stated that there was ice in the bunkers or in or on the load. Shipments in "uniced" refrigerator cars included those in which the ventilators were either open or closed. In some instances these cars were heated, or unlighted heaters were in the cars).
- APPLES: A very large part of the apple shipments were in uniced refrigerator cars. Shipments that were under refrigeration were made during the late spring and summer or in the early fall months. In the case of shipments from western States, provisions were made for heating the cars in cold weather.

CABBAGE: Most shipments from the south were under refrigeration, although there was some movement in uniced refrigerator cars. Most of the shipments from northern

States were in uniced refrigerator cars.

CELERY: Practically all western and southern shipments were under refrigeration.

GRAPEFRUIT: Shipments were largely in uniced refrigerator cars but there was some movement under refrigeration during the warmer months. A few Florida shipments

were in box cars.

GRAPES: Most of the California shipments were under refrigeration. Some California shipments and a large part of the shipments from other States were in uniced refrigerator cars.

ONIONS: Shipments were practically all in uniced refrigerator cars. Provisions were

made for heating the cars in cold weather.

ORANGES: Shipments in the winter and some in the fall and spring were in uniced refrigerator cars. During the summer and for some shipments in the spring and fall refrigeration was used. A few Florida shipments were in the box cars.

<u>PEARS</u>: Shipments of western pears during the summer and early fall months were mostly under refrigeration. Shipments later in the season were largely in uniced refrigerator cars. A majority of the shipments from New York and Michigan were in uniced refrigerator cars.

POTATOES: Late-crop shipments were mostly in uniced refrigerator cars. In cold weather provisions were made for heating the cars. Some shipments of new potatoes in the spring and summer were under refrigeration. Many shipments from Florida, North Carolina, South Carolina, and New Jersey were in box cars under ventilation.

SWEETPOTATOES: Uniced refrigerator cars were used.

TOMATOES: A very large part of the carlot movement for the United States was in uniced refrigerator cars. Some shipments were under refrigeration.

WATERMELONS: All shipments included in the tabulation were in box cars.

1

Practically all shipments of the following commodities according to the tabulation were under refrigeration: beans, cantaloups, carrots, cauliflower, corn, lettuce, peaches, peas, peppers, plums and prunes, rhubarb (Washington), spinach, and strawberries.
